

EXP NO:2 Run a basic Word Count Map Reduce program to understand Map Reduce Paradigm.

AIM:

To run a basic Word Count MapReduce program.

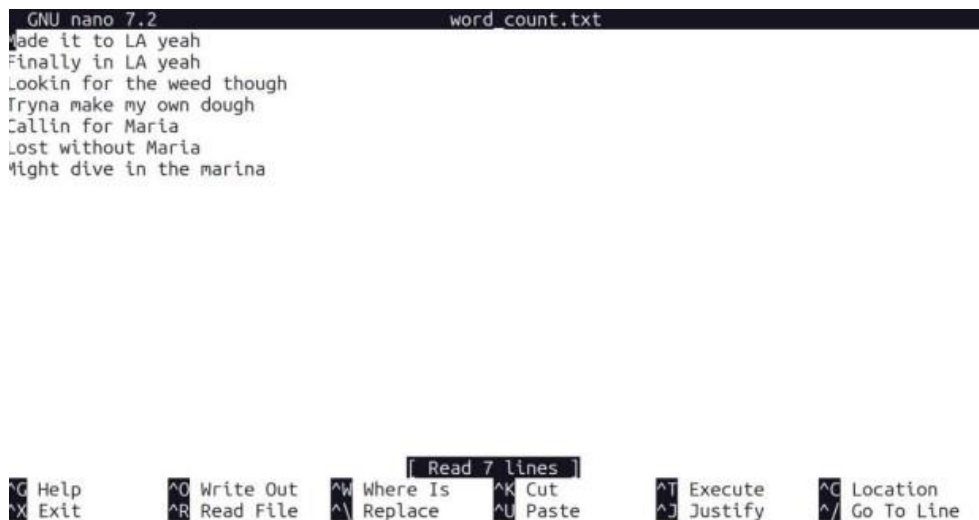

PROCEDURE:

Step 1 : Create Data File:

Create a file named "word_count_data.txt" and populate it with text data that you wish to analyse. Login with your hadoop user.

\$nano word_count.txt

Output:

```
GNU nano 7.2 word_count.txt
made it to LA yeah
Finally in LA yeah
Lookin for the weed though
Iryna make my own dough
Callin for Maria
Lost without Maria
Hight dive in the marina

[ Read 7 lines ]
^G Help      ^O Write Out  ^W Where Is   ^K Cut        ^T Execute    ^C Location
^X Exit      ^R Read File  ^_ Replace    ^U Paste      ^J Justify    ^_ Go To Line
```

Step 2: Mapper Logic - mapper.py:

Create a file named "mapper.py" to implement the logic for the mapper. The mapper will read input data from STDIN, split lines into words, and output each word with its count.

\$nano mapper.py

CODE:

Mapper.py

```
#!/usr/bin/env python3
# import sys because we need to read and write data to STDIN and STDOUT
#!/usr/bin/python3
import sys
for line in sys.stdin:
```

```
line = line.strip() # remove leading and trailing whitespace
words = line.split() # split the line into words
for word in words: nano word_count.txt
    print( '%s\t%s' % (word, 1))
```

Step 3: Reducer Logic - reducer.py:

\$nano reducer.py

CODE:

Reducer.py

```
#!/usr/bin/python3
from operator import itemgetter
import sys
current_word = None
current_count = 0
word = None
for line in sys.stdin:
    line = line.strip()
    word, count = line.split('\t', 1)
    try:
        count = int(count)
    except ValueError:
        continue
    if current_word == word:
        current_count += count
    else:
        if current_word:
            print( '%s\t%s' % (current_word, current_count)) current_count =
count
        current_word = word
    if current_word == word:
        print( '%s\t%s' % (current_word, current_count))
```

Step 4: Prepare Hadoop Environment:

Start the Hadoop daemons and create a directory in HDFS to store your data.

start-all.sh

hdfsdfs -mkdir /word_count_in_python

hdfsdfs -copyFromLocal /path/to/word_count.txt/word_count_in_python

Step 6: Make Python Files Executable:

Give executable permissions to your mapper.py and reducer.py files.

chmod 777 mapper.py reducer.py

Step 7: Run Word Count using Hadoop Streaming:

Download the latest hadoop-streaming jar file and place it in a location you can easily access. Then run the Word Count program using Hadoop Streaming.

```
hadoop jar /path/to/hadoop-streaming-3.3.6.jar \  
-input /word_count_in_python/word_count_data.txt \  
-output /word_count_in_python/new_output \  
-mapper /path/to/mapper.py \  
-reducer /path/to/reducer.py
```

```
hadoop@ubuntu:/home ~/wordcount$ hadoop jar /home/hadoop/Documents/hadoop-streaming-3.3.6.jar -input  
t /word_count_in_python/word_count.txt -output /word_count_in_python/output -mapper mapper.py -r  
educer reducer.py

```

Step 8: Check Output:

Check the output of the Word Count program in the specified HDFS output directory.

hdfs dfs -cat /word_count_in_python/output/part-00000

OUTPUT:

```
hadoop@ubuntu:/home :~/wordcount$ hdfs dfs -cat /word_count_in_python/output/part-00000
Callin 1
Finally 1
LA 2
Lookin 1
Lost 1
Made 1
Maria 2
Might 1
Tryna 1
dive 1
dough 1
for 2
in 2
it 1
```

RESULT:

Thus, the program for basic Word Count Map Reduce has been executed successfully.
